

ABSTRACT

A method, apparatus, and system are provided for a monitor viewer in an enterprise network monitoring system. In one embodiment, upon selecting a monitor service tree node, a monitor tree (e.g., a graphical representation of one or more monitored/managed resources) is displayed in a graphical user interface. The displayed monitor tree may have one or more selectable monitor tree nodes, wherein each of the monitor tree nodes is a graphical representation of a monitored/managed resource. In an embodiment, a monitor tree node may be selected and configured in the graphical user interface.
